

综合练习一

一、填空题

1. 0.61. 2. $1/3$. 3. $F(x) = \begin{cases} \frac{1}{x^2+1}, & x < 0 \\ 1, & x \geq 0 \end{cases}$. 4. $1/2e$. 5. $\frac{\sigma^2}{n}$.

6. $\left(\bar{X} - t_{\frac{\alpha}{2}}(n-1) \frac{S}{\sqrt{n}}, \bar{X} + t_{\frac{\alpha}{2}}(n-1) \frac{S}{\sqrt{n}} \right)$

二、单项选择题

1. A 2. C 3. B 4. B 5. D 6. D

三、按照要求解答下列各题

1. 解: (1) 由全概率公式

$$P(B_1) = P(A_1) \cdot P(B_1 | A_1) + P(A_2) \cdot P(B_1 | A_2)$$

$$= 0.7 \times 0.8 + 0.3 \times 0.2 = 0.62$$

$$P(B_2) = 0.7 \times 0.1 + 0.3 \times 0.7 = 0.28$$

$$P(B_3) = 0.7 \times 0.1 + 0.3 \times 0.1 = 0.1$$

(2) 由贝叶斯公式得

$$P(A_2 | B_3) = \frac{P(A_2)P(B_3 | A_2)}{P(A_1)P(B_3 | A_1) + P(A_2)P(B_3 | A_2)}$$

$$= \frac{0.3 \times 0.1}{0.7 \times 0.1 + 0.3 \times 0.1} = 0.3$$

2. 解: (1) $F(-\infty) = 0, F(+\infty) = 1$ 得,

$$A + B\left(-\frac{\pi}{2}\right) = 0, A + B\left(\frac{\pi}{2}\right) = 1, \text{得} A = \frac{1}{2}, B = \frac{1}{\pi}$$

$$P(-1 < x < 1) = F(1) - F(-1)$$

$$(2) = \left(\frac{1}{2} + \frac{1}{\pi} \cdot \frac{\pi}{4}\right) - \left(\frac{1}{2} - \frac{1}{\pi} \cdot \frac{\pi}{4}\right) = \frac{1}{2}$$

(3) X 的概率密度函数 $f(x) = F'(x) = \frac{1}{\pi(1+x^2)}, -\infty < x < +\infty$

3. 解: (1)

$\begin{matrix} X \\ Y \end{matrix}$	-1	0	1	$P_{\cdot j}$
0	$\frac{1}{4}$	0	$\frac{1}{4}$	$\frac{1}{2}$
1	0	$\frac{1}{2}$	0	$\frac{1}{2}$
$P_{i \cdot}$	$\frac{1}{4}$	$\frac{1}{2}$	$\frac{1}{4}$	1

(2) 由 X 和 Y 的联合分布律和边缘分布律可知

$$p\{X = -1, Y = 0\} = \frac{1}{4}, \quad P\{X = -1\} \cdot P\{Y = 0\} = \frac{1}{4} \times \frac{1}{2} = \frac{1}{8}$$

所以 X 和 Y 不相互独立。

4. 解: (1) 由 $EX = 1, DX = 9, EY = 0, DY = 16,$

$$\text{得 } EZ = E\left(\frac{X}{3} + \frac{Y}{2}\right) = \frac{1}{3}EX + \frac{1}{2}EY = \frac{1}{3},$$

$$DZ = D\left(\frac{X}{3} + \frac{Y}{2}\right) = D\left(\frac{X}{3}\right) + D\left(\frac{Y}{2}\right) + 2\text{Cov}\left(\frac{X}{3}, \frac{Y}{2}\right)$$

$$= \frac{1}{9}DX + \frac{1}{4}DY + \frac{1}{3}\text{Cov}(X, Y)$$

$$= \frac{1}{9}DX + \frac{1}{4}DY + \frac{1}{3}\rho_{XY}\sqrt{DX}\sqrt{DY} = 1 + 4 - 2 = 3$$

$$\text{Cov}(X, Z) = \text{Cov}\left(X, \frac{X}{3} + \frac{Y}{2}\right) = \frac{1}{3}\text{Cov}(X, X) + \frac{1}{2}\text{Cov}(X, Y)$$

(2)

$$= \frac{1}{3}DX + \frac{1}{2}\rho_{XY}\sqrt{DX}\sqrt{DY} = 3 - 3 = 0$$

所以 $\rho_{XY} = 0$

(3) 由于二维正态随机变量相关系数为零和相互独立两者是等价的结论, 可知 X 与 Z 是相互独立的。

5. 解: 由于

$$\mu_1 = EX = \int_0^1 \sqrt{\theta} x^{\sqrt{\theta}} dx = \frac{\sqrt{\theta}}{\sqrt{\theta}+1}$$

令 $\mu_1 = A_1$, 即

$$\text{解得 } \theta \text{ 的矩估计量为 } \hat{\theta} = \left(\frac{\bar{X}}{1-\bar{X}} \right)^2$$

设 $x_1, x_2, \dots, x_n$ 为样本值, 似然函数为

$$L(\theta) = \prod_{i=1}^n f(x_i, \theta) = \prod_{i=1}^n \sqrt{\theta} x_i^{\sqrt{\theta}-1} = \theta^{\frac{n}{2}} (\prod_{i=1}^n x_i)^{\sqrt{\theta}-1}$$

取对数, 得

$$\ln L(\theta) = \frac{n}{2} \ln \theta + (\sqrt{\theta} - 1) \sum_{i=1}^n \ln x_i$$

$$\text{令 } \frac{d \ln L(\theta)}{d\theta} = \frac{n}{2} \cdot \frac{1}{\theta} + \frac{1}{2\sqrt{\theta}} \sum_{i=1}^n \ln x_i = 0$$

$$\text{解得 } \theta \text{ 的最大似然估计值为 } \hat{\theta} = \frac{n^2}{(\sum_{i=1}^n \ln x_i)^2},$$

$$\theta \text{ 的最大似然估计量为 } \hat{\theta} = \frac{n^2}{(\sum_{i=1}^n \ln X_i)^2}$$

四、按照要求解答下列各题

1. 解: 设 Y 的分布函数为 $F_Y(y) = P\{Y \leq y\}$.

当 $y < 0$ 时, $F_Y(y) = P\{Y \leq y\} = P\{X^2 \leq y\} = 0$,

当 $y \geq 0$ 时, $F_Y(y) = P\{Y \leq y\} = P\{X^2 \leq y\} = F_X(\sqrt{y}) - F_X(-\sqrt{y})$,

因此 Y 的概率密度函数为 $f_Y(y) = \begin{cases} \frac{1}{2\sqrt{y}} e^{-\sqrt{y}}, & y > 0, \\ 0, & y < 0. \end{cases}$

2. 解: $D(\hat{\theta}_1) = D(2\bar{X}) = 4D(\bar{X}) = 4 \frac{D(X)}{n} = 4 \frac{\theta^2}{12n} = \frac{\theta^2}{3n}$,

记 $Y = \max(X_1, X_2, \dots, X_n)$, 则 $\hat{\theta}_2 = \frac{n+1}{n}Y$

$$\text{由 } f_Y(y) = \begin{cases} \frac{ny^{n-1}}{\theta^n} & 0 < y < \theta \\ 0 & \text{其他} \end{cases} \Rightarrow \begin{cases} E(Y) = \int_0^\theta y \frac{ny^{n-1}}{\theta^n} dy = \frac{n}{n+1}\theta \\ E(Y^2) = \int_0^\theta y^2 \frac{ny^{n-1}}{\theta^n} dy = \frac{n}{n+2}\theta^2 \end{cases}$$

$$\text{于是 } D(\hat{\theta}_2) = \frac{(n+1)^2}{n^2} D(Y) = \frac{(n+1)^2}{n^2} [E(Y^2) - E^2(Y)] = \frac{\theta^2}{n(n+2)}.$$

因为 $D(\hat{\theta}_2) = \frac{\theta^2}{n(n+2)} < \frac{\theta^2}{3n} = D(\hat{\theta}_1)$, 所以 $\hat{\theta}_2$ 比 $\hat{\theta}_1$ 更有效

综合练习二

一、填空题

1. 0.58; 2. 0.18 ; 3. $f_Y(y) = \begin{cases} \frac{y-1}{2} & 1 < y < 3 \\ 0 & \text{其他} \end{cases}$; 4. $\frac{1}{9}$; 5. (4.71, 5.69);

6. $\frac{\bar{X} - \mu_0}{\sigma} \sqrt{n}.$

二、单项选择题

1. B 2. C 3. A 4. C 5. D 6. D

三、解答下列各题

1. 解: (1)

X	0	1	2
P	$\frac{1}{6}$	$\frac{2}{3}$	$\frac{1}{6}$

(2) 设 B_i 为从甲箱中取出2件含有 i 件次品的事件 ($i=0, 1, 2$) , A 为从乙箱中任取一件是次品的事件, 由全概率公式

$$P(A) = P(A|B_0) \cdot P(B_0) + P(A|B_1) \cdot P(B_1) + P(A|B_2) \cdot P(B_2)$$

$$= 0 + \frac{1}{4} \times \frac{2}{3} + \frac{2}{4} \times \frac{1}{6} = \frac{1}{4}.$$

2. 解 (1) X 的分布函数为

$$F(x) = \int_{-\infty}^x f(t) dt = \begin{cases} \frac{1}{2} e^x, & x < 0, \\ 1 - \frac{1}{2} e^{-x}, & x \geq 0. \end{cases}$$

$$(2) \quad E(X) = \frac{1}{2} \int_{-\infty}^{\infty} x e^{-|x|} dx = 0, \quad E(X^2) = \frac{1}{2} \int_{-\infty}^{\infty} x^2 e^{-|x|} dx = \int_0^{\infty} x^2 e^{-x} dx = 2,$$

$$D(X) = E(X^2) - E^2(X) = 2.$$

3. 解 (1) 二维离散型随机变量 (X_1, X_2) 的联合概率分布为

$X_1 \backslash X_2$	0	1
0	0.1	0.1
1	0.8	0

$$(2) E(X_1) = 0.8, E(X_2) = 0.1, E(X_1 X_2) = 0, D(X_1) = 0.16, D(X_2) = 0.09$$

$$\text{Cov}(X_1, X_2) = E(X_1 X_2) - E(X_1)E(X_2) = -0.08.$$

$$4. \text{ 解 } E(\bar{T}_1 - \bar{T}_2) = 0, D(\bar{T}_1 - \bar{T}_2) = \frac{25}{20} + \frac{25}{12} = \frac{10}{3}, \bar{T}_1 - \bar{T}_2 \sim N(0, \frac{10}{3}),$$

$$P\{|\bar{T}_1 - \bar{T}_2| > 1\} = 1 - P\{|\bar{T}_1 - \bar{T}_2| \leq 1\} = 2 - 2\Phi(\sqrt{\frac{3}{10}}) = 0.5824.$$

$$5. \text{ 解 } \text{ 由 } \frac{(n-1)S^2}{\sigma^2} \sim \chi^2(n-1), \text{ 得}$$

$$E(S^2) = \sigma^2 = 4, D(S^2) = \frac{2\sigma^4}{n-1} = 4,$$

又因 $\bar{X}^2$ 与 $(S^2)^2$ 相互独立, $E(\bar{X}) = 1, D(\bar{X}) = 4/9$, 从而

$$\begin{aligned} E[(\bar{X}S^2)^2] &= E[\bar{X}^2]E[(S^2)^2] \\ &= \{D(\bar{X}) + [E(\bar{X})]^2\}\{D(S^2) + [E(S^2)]^2\}, \\ &= \left(\frac{\sigma^2}{n} + \mu^2\right)\left(\frac{2\sigma^4}{n-1} + \sigma^4\right) = \frac{260}{9}. \end{aligned}$$

四、解答下列各题

$$1. \text{ 解 } (1) \text{ 由 } \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} f(x, y) dx dy = 1, \text{ 有}$$

$$C \int_0^1 dx \int_0^2 x dy = C = 1.$$

$$(2) P\{X + Y > 1\} = 1 - \int_0^1 x dx \int_0^{1-x} dx = \frac{5}{6}$$

(3) 因为

$$f_X(x) = \int_{-\infty}^{+\infty} f(x, y) dy = \begin{cases} 2x, & 0 < x < 1, \\ 0, & \text{其他} \end{cases}$$

$$f_Y(y) = \int_{-\infty}^{+\infty} f(x, y) dx = \begin{cases} \frac{1}{2}, & 0 < y < 2, \\ 0, & \text{其他} \end{cases}$$

显然，对任意实数 x 和 y ，都有 $f(x, y) = f_X(x) \cdot f_Y(y)$

所以 X 与 Y 相互独立.

$$2. \text{ 解 (1) } E(X) = \int_0^1 x \frac{1}{\theta} x^{\frac{1-\theta}{\theta}} dx = \frac{1}{\theta+1} \dots\dots 2 \text{ 分}$$

$$\text{令 } E(X) = \bar{X} \Rightarrow \theta \text{ 的矩估计量 } \hat{\theta} = \frac{1 - \bar{X}}{\bar{X}}.$$

(2) 设 $x_1, \dots, x_n$ 为一组样本值

$$\text{似然函数为 } L(\theta) = \prod_{i=1}^n \frac{1}{\theta} x_i^{\frac{1-\theta}{\theta}} = \left(\frac{1}{\theta}\right)^n \left(\prod_{i=1}^n x_i\right)^{\frac{1-\theta}{\theta}}, \quad 0 < x_1, \dots, x_n < 1$$

$$\text{取对数 } \ln L(\theta) = -n \ln \theta + \frac{1-\theta}{\theta} \ln\left(\prod_{i=1}^n x_i\right),$$

$$\text{令 } \frac{d \ln L(\theta)}{d\theta} = 0 \text{ 即 } -\frac{n}{\theta} - \frac{1}{\theta^2} \sum_{i=1}^n \ln x_i = 0, \text{ 得 } \hat{\theta} = -\frac{1}{n} \sum_{i=1}^n \ln x_i.$$

$$\text{最大似然估计量为 } \hat{\theta} = -\frac{1}{n} \sum_{i=1}^n \ln X_i.$$
